Contour detection

we're on it.

Contour detection

Your **benefits** at a glance:

- due to the non-contact detection of the outer contour of the bottle's bottom, different article forms can be fed to the machine without advance direction
- the evaluation software automatically detects the article's outer contour

- the prerequisite for contour recognition is a bottom register camera system
- with the extended software package for the contour recognition, the bottom contour of an article can be recognized
- the software determines the angular position of the outer contour and transmits this value to the machine software
- the contour detection allows the software to pre-position the base chuck to match with the article outer contour
- the system is used on almost all article shapes and materials
- various bottom contours can be taught in the camera software during set-up

Characteristics

- software adaption
- prerequisite is an installed bottom register camera
- the retrofit can be done independently
- however, we recommend the retrofitting by one of our qualified service technicians as a thorough training in terms of functionality and setting of the software makes sense
