

KOENIG & BAUER

**Neck printing station**

we're on it.

# Neck printing station

- flexible distribution of print images on both types of printing stations possible:
  - printing only in the mantle sieve
  - printing only in the neck sieve
  - a combination of both printing types
- savings potential for one printing station in the machine
- the neck printing unit is specially designed for decorating bottle necks of glass or plastic articles
- the slim and compact design allows the usage as a single station or in combination with a (presently) mantle printing station

## Characteristics

- in addition to software expansion, mechanical and electrical retrofitting of components is required
- we recommend the retrofitting by one of our qualified service technicians
- this offers the advantage to directly train the machine operators in terms of functionality, configuration and operating principle
